Known Limitations

Currently, chapter 5 Dependencies to other modules does not describe the versions of dependent modules. Thus, a version check will extend the chapter.

1 Introduction and functional overview

This specification specifies the functionality, API and the configuration of the AUTOSAR Basic Software module Ethernet Driver.

In the AUTOSAR Layered Software Architecture, the Ethernet Driver belongs to the *Microcontroller Abstraction Layer*, or more precisely, to the *Communication Drivers*.

This indicates the main task of the Ethernet Driver:

Provide to the upper layer (Ethernet Interface) a hardware independent interface comprising multiple equal controllers. This interface shall be uniform for all controllers. Thus, the upper layer (Ethernet Interface) may access the underlying bus system in a uniform manner. The interface provides functionality for initialization, configuration and data transmission. The configuration of the Ethernet Driver however is bus specific, since it takes into account the specific features of the communication controller.

A single Ethernet Driver module supports only one type of controller hardware, but several controllers of the same type. Additionally, the Ethernet Driver has to be able to be interoperable with the Switch Driver, if it is in a managed mode. In this case, a special treatment of the Ethernet frame might be necessary to fit a specific interpretation by a Switch device afterwards. The Ethernet Driver's prefix requires a unique namespace. The Ethernet Interface can access different controller types using different Ethernet Drivers using this prefix. The decision which driver to use to access a particular controller is a configuration parameter of the Ethernet Interface.

Figure 1.1 depicts the lower part of the Ethernet stack. One Ethernet Interface accesses several controllers using one or several Ethernet Drivers.

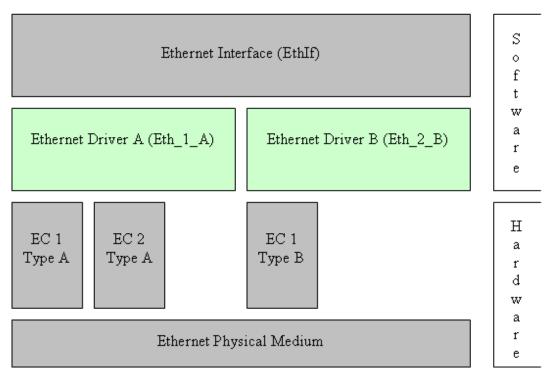

Figure 1.1: Ethernet stack module overview

Note: The Ethernet Driver is specified in a way that allows for object code delivery of the code module, following the "one-fits-all" principle, i.e. the entire configuration of the Ethernet Interface can be carried out without modifying any source code. Thus, the configuration of the Ethernet Driver can be carried out largely without detailed knowledge of the Ethernet Driver software.

2 Acronyms and abbreviations

Abbreviation / Acronym:	Description:
EC	Ethernet controller
Eth	Ethernet Driver (AUTOSAR BSW module)
EthIf	Ethernet Interface (AUTOSAR BSW module)
EthTrcv	Ethernet Transceiver Driver (AUTOSAR BSW module)
ISR	Interrupt Service Routine
MCG	Module Configuration Generator
MII	Media Independent Interface (standardized Interface provided by
	Ethernet controllers to access Ethernet transceivers)
TCP	Transmission Control Protocol
UDP	User Datagram Protocol

3.3 Related specification

AUTOSAR provides a General Specification on Basic Software modules [19] (SWS BSW General), which is also valid for Ethernet Driver.

Thus, the specification SWS BSW General shall be considered as additional and required specification for Ethernet Driver.

4 Constraints and assumptions

4.1 Limitations

The Ethernet Driver module is only able to handle a single thread of execution. The execution must not be pre-empted by itself.

It is not possible to transmit data which exceeds the available buffer size of the used controller. Longer data has to be transmitted using the Internet Protocol (IP) or Transmission Control Protocol (TCP).

Depending on the Ethernet hardware, it may become necessary that implementations deviate from API specifications in respect to the asynchronous/synchronous behaviour.

4.2 Applicability to car domains

The Ethernet BSW stack is intended to be used wherever high data rates are required but no hard real-time is required. Of course, it can also be used for less-demanding use cases, i.e. for low data rates.

5 Dependencies to other modules

This chapter lists the modules interacting with the Ethernet Driver module.

Modules that use Ethernet Driver module:

- Ethernet Interface (EthIf)
- Ethernet Transceiver Driver (EthTrcv)

Modules used by the Ethernet Driver module:

BSW Scheduler mechanisms for data consistency and main function handling.

Dependencies to other Modules:

 On certain systems the controller might share resources with other components (e.g. the MCU, Port), and may depend on their configuration. If those resources are within scope of the other modules (e.g. PLL configuration, memory mapping, etc.) the Ethernet Driver module does not take care of configuring those components but requires their preceding initialization.

5.1 File structure

5.1.1 Header file structure

6 Requirements traceability

Requirement	Description	Satisfied by
SRS_BSW_00101	The Basic Software Module shall be able to initialize variables and hardware in a separate initialization function	SWS_Eth_00248, SWS_Eth_00252
SRS_BSW_00323	All AUTOSAR Basic Software Modules shall check passed API parameters for validity	SWS_Eth_00249, SWS_Eth_00250, SWS_Eth_00253, SWS_Eth_00254
SRS_BSW_00369	All AUTOSAR Basic Software Modules shall not return specific development error codes via the API	SWS_Eth_00249, SWS_Eth_00250, SWS_Eth_00253, SWS_Eth_00254
SRS_BSW_00416	The sequence of modules to be initialized shall be configurable	SWS_Eth_00248, SWS_Eth_00252
SRS_Eth_00053	SWS shall specify configuration	SWS_Eth_00251, SWS_Eth_00255
SRS_ETH_00086	-	SWS_Eth_91001
SRS_Eth_00127	The Ethernet Driver shall provide statistic counter values	SWS_Eth_00026, SWS_Eth_00226, SWS_Eth_00233, SWS_Eth_91002, SWS_Eth_91003, SWS_Eth_91004, SWS_Eth_91005, SWS_Eth_91006

7 Functional specification

7.1 Ethernet BSW stack

As part of the AUTOSAR Layered Software Architecture according to Figure 7.1, the Ethernet BSW modules also form a layered software stack. Figure 7.1 depicts the basic structure of this Ethernet BSW stack. The Ethernet Interface module accesses several controllers using the Ethernet Driver layer, which can be made up of several Ethernet Drivers modules.

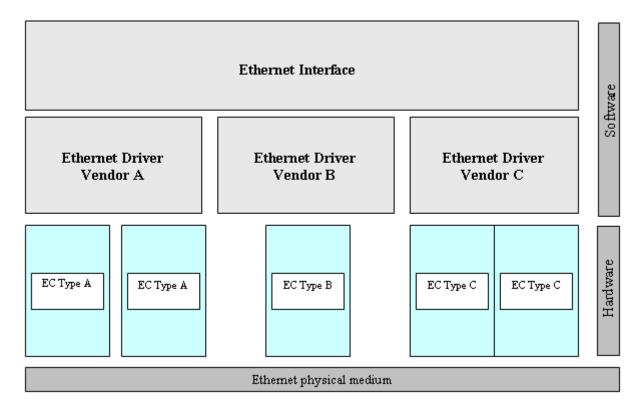

Figure 7.1: Basic Structure of the Ethernet BSW stack

Furthermore a Switch device might be connected to a dedicated controller index of an Ethernet Driver. This scenario leads to additional interaction between the Switch Driver and the Ethernet Driver [Figure 7.2]. The Ethernet Driver ask the Switch Driver for a special treatment to ensure that the current Ethernet frame could be managed in the Switch later on.

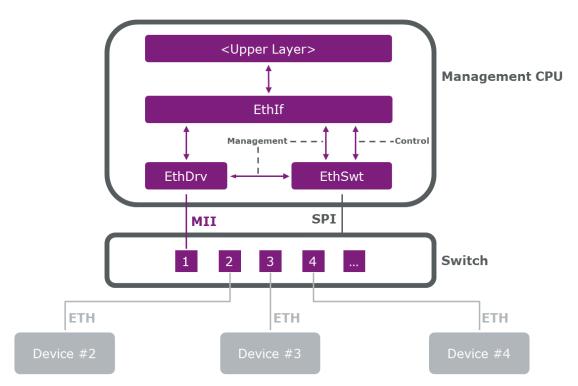

Figure 7.2: HW/SW basic structure including Switch device

7.1.1 Indexing scheme

Users of the Ethernet Driver identify controller resources using an indexing scheme as depicted in Figure 7.3.

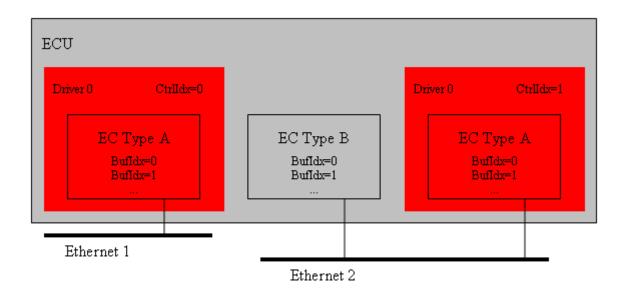

Figure 7.3: Ethernet Driver indexing scheme

[SWS_Eth_00003] [

The Ethernet Driver is using a zero-based index to abstract the access for upper software layers. The parameter Eth_Ctrlldx within configuration corresponds to parameter Ctrlldx used in the API. |()

[SWS_Eth_00004] [

A buffer index (Bufldx) indentifies an Ethernet buffer processed by Ethernet Driver API functions. Each controller's buffers are identified by buffer indexes 0 to (n-1) where n is the number of buffers processed by the corresponding controller. Buffer indexes are valid within a tuple <Ctrlldx, Bufldx> only. A Bufldx uniquely identifies the buffer used for an Ethernet Driver. |()

7.1.2 Requirements

This chapter lists requirements that shall be fulfilled by Ethernet Driver module implementations.

The Ethernet Driver module environment comprises all modules which are calling interfaces of the Ethernet Driver module.

[SWS_Eth_00005] [

The Ethernet Driver module shall support pre-compile time, link time and post-build time configuration. |()

[SWS_Eth_00006] [

The header file *Eth.h* shall include a software and specification version number. (1)

[SWS Eth 00007] [

The Ethernet Driver module shall perform a consistency check between code files and header files based on pre-process-checking the version numbers of related code files and header files. |()

[SWS Eth 00008] [

In case development error detection is enabled for the Ethernet Driver module: The Ethernet Driver module shall check API parameters for validity and report detected errors to the DET. |()

DET API functions are specified in [16].

[SWS_Eth_00011] [

None of the Ethernet Driver module header files shall define global variables. (1)

[SWS Eth 00218] [

The Ethernet Driver shall ensure that the base addresses of all reception and transmission buffers fulfill the memory alignment requirements for all AUTOSAR data types of the respective platform. I()

[SWS Eth 00216] [

For transmissions the Ethernet Controller shall enable hardware capabilities for the calculation of protocol checksums (offloading) according to the following list:

- a) for IPv4 frames if EthCtrlEnableOffloadChecksumIPv4 is set to TRUE
- b) for ICMP frames if EthCtrlEnableOffloadChecksumICMP is set to TRUE
- c) for TCP frames if EthCtrlEnableOffloadChecksumTCP is set to TRUE
- d) for UDP frames if EthCtrlEnableOffloadChecksumUDP is set to TRUE.

In all other cases, the Ethernet Controller shall not manipulate the checksum fields. <u>J()</u>

[SWS_Eth_00217] [

For reception the Ethernet Controller shall enable hardware capabilities to discard frames with mismatching protocol checksums (offloading) according to the following list:

- a) for IPv4 frames if EthCtrlEnableOffloadChecksumIPv4 is set to TRUE
- b) for ICMP frames if EthCtrlEnableOffloadChecksumICMP is set to TRUE
- c) for TCP frames if EthCtrlEnableOffloadChecksumTCP is set to TRUE
- d) for UDP frames if EthCtrlEnableOffloadChecksumUDP is set to TRUE. In all other cases, the Ethernet Controller shall not consider the protocol checksum fields.]()

[SWS Eth 00176] [

The Global Time interfaces shall be used to access the time synchronization functionalities (see document [23]). |()

[SWS_Eth_00243] [

Ethernet SW Driver shall call EthIf_TxConfirmation with Result set to E_OK to indicate a successful transmission; either from the Interrupt routine (in interrupt mode) or from the Eth_TxConfirmation routine in polling mode (if the notification has been enabled). | ()

[SWS_Eth_00256][

Ethernet SW Driver shall call EthIf_TxConfirmation with Result set to E_NOT_OK if the transmission failed.| ()

The call to EthIf_TxConfirmation with Result set to E_NOT_OK shall allow the upper layer to implement a simple locking scheme. It can rely on the fact that every time Eth_Transmit is called, EthIf_TxConfirmation will be called afterwards.

[SWS Eth 00244] [

Ethernet SW Driver shall call EthIf_RxIndication to indicate a successful reception either from the Interrupt routine (in interrupt mode) or from the Eth_Receive routine in polling mode (please refer to SWC_ETH_0096) |()

[SWS_Eth_00247][

The Switch Driver management API's:

EthSwt EthRxProcessFrame().

EthSwt EthRxFinishedIndication(),

EthSwt_EthTxPrepareFrame(),

EthSwt_EthTxAdaptBufferLength(),

EthSwt_EthTxProcessFrame() and

EthSwt EthTxFinishedIndication()

shall be used to inform the Switch Driver about a required special treatment for Switch management purpose (see document AUTOSAR_SWS_EthernetInterface). I()

7.1.3 Configuration description

[SWS_Eth_00012] [

The Ethernet Driver module shall provide an XML file that contains the data, which is required for the SW identification (it shall contain the vendor identification, module ID and software version information), configuration and integration process. This file should describe vendor specific configuration parameters as well as it should contain recommended configuration parameter values. (()

[SWS_Eth_00125] [

The MCG shall read the ECU configuration description of the Ethernet Driver module(s). Ethernet Driver related configuration data is contained in the Ethernet Driver module configuration description. |()

[SWS_Eth_00126] [

The MCG shall ensure the consistency of the generated configuration data. (1)

[SWS_Eth_00013][

The configuration of the Ethernet Driver module shall be calculated at ECU configuration time. None of the communication parameters shall be calculated at runtime. |()

[SWS_Eth_00014] [

The start address of post-build time configuration data shall be passed during module initialization (see chapter 8.3.1). |()

An assignment of those configuration classes to configuration parameters can be found in chapter 10.

A detailed description of all Ethernet Driver related configuration parameters can be found in chapter 10 of this document.

7.2 Error classification

7.2.1 Development Errors

[SWS_Eth_00016] [

Type or error	Relevance	Related error code	Value [hex]
Invalid controller index	Development	ETH_E_INV_CTRL_IDX	0x01
	error		
Eth module or	Development	ETH_E_UNINIT	0x02

controller was not initialized	error		
Invalid pointer in	Development	ETH_E_PARAM_POINTER	0x03
parameter list	error

	error		

|()

7.2.2 Runtime Errors

There are no runtime errors.

7.2.3 Transient Faults

There are no transient faults.

7.2.4 Production Errors

There are no production errors.

7.2.5 Extended Production Errors

Extended production errors are handled as events of the Diagnostic Event Manager. The event IDs are defined in the following tables, while the actual values are assigned externally by the configuration of the Diagnostic Event Manager, and are included in the module via Dem.h.

[SWS_Eth_00173] [

Error Name:	ETH_E_ACCESS	
Short Description:	Ethernet Conti	roller Access Failure.
Long Description:	Monitors the a	ccess to the Ethernet Controller.
		When access to the Ethernet Controller fails the module shall report the extended production error with event status DEM_EVENT_STATUS_PREFAILED to DEM.
Detection Criteria:		When access to the Ethernet Controller succeds the module shall report the extended production error with event status DEM_EVENT_STATUS_PREPASSED to DEM.

[SWS_Eth_00161] [

Name:	Eth_DataType
Type:	uint8, uint16, uint32
_	This type defines the Ethernet data type used for data transmission. Its definition depends on the used CPU.

1 ()

8.2.6 Eth_BufldxType

[SWS_Eth_00175] [

Name:	Eth_BufIdxType
Type:	uint32
Description:	Ethernet buffer identifier type.

] ()

8.2.7 Eth_RxStatusType

[SWS_Eth_00162] [

Name:	Eth_RxStatusType
Type:	Enumeration

Range:	ETH_RECEIVED		Ethernet frame has been received, no further frames available
	ETH_NOT_RECEIVED		Ethernet frame has not been received, no further frames available
	ETH_RECEIVED_MORE_DATA_AVAILABLE		Ethernet frame has been received, more frames are available
	Used as out parameter in Eth_Receive() indicates whether a frame has been received and if so, whether more frames are available or frames got lost.		

]()

8.2.8 Eth_FilterActionType

[SWS_Eth_00163] [

<u> </u>				
Name:	Eth_FilterActionType			
Type:	Enumeration			
Range:	ETH_ADD_TO_FILTER		add the MAC address to the filter, meaning allow reception	
	ETH_REMOVE_FROM_FILTER		remove the MAC address from the filter, meaning reception is blocked in the lower layer	
	The Enumeration Type Eth_FilterActionType describes the action to be taklen for the MAC address given in *PhysAddrPtr.			

]()

8.2.9 Eth_TimeStampQualType

[SWS_Eth_00177] [

Name:	Eth_TimeStampQualType				
Туре:					
Range:	ETH_VALID	0			
	ETH_INVALID	1			
	ETH_UNCERTAIN	2			
Description:	might be supported	Depending on the HW, quality information regarding the evaluated time stamp might be supported. If not supported, the value shall be always Valid. For Uncertain and Invalid values, the upper layer shall discard the time stamp.			

] ()

8.2.10 Eth_TimeStampType

[SWS_Eth_00178] [

	- 4			
Name:	Eth_TimeSta	Eth_TimeStampType		
Туре:	Structure	Structure		
Element:	uint32	nanoseconds	Nanoseconds part of the time	
	uint32	seconds	32 bit LSB of the 48 bits Seconds part of the time	
	uint16	secondsHi	16 bit MSB of the 48 bits Seconds part of the time	
Description:		Variables of this type are used for expressing time stamps including relative time and absolute calendar time. The absolute time starts at 1970-01-01.		

0 to 281474976710655s == 3257812230d [0xFFFF FFFF FFFF]
0 to 999999999ns [0x3B9A C9FF] invalid value in nanoseconds: [0x3B9A CA00] to [0x3FFF FFFF] Bit 30 and 31 reserved, default: 0

]()

8.2.11 Eth_TimeIntDiffType

[SWS_Eth_00179] [

[00					
Name:	Eth_TimeIntD	Eth_TimeIntDiffType			
Туре:	Structure	Structure			
Element:	Eth_TimeStam	pTypediff	time difference		
	boolean	sign	Positive (True) / negative (False) time		
Description:	Variables of this	Variables of this type are used to express time differences.			

]()

8.2.12 Eth_RateRatioType

[SWS_Eth_00180] [

<u> </u>				
Name:	Eth_RateRatioType			
Type:	Structure			
Element:	Eth_TimeIntDiffType	IngressTimeStampDelta	IngressTimeStampSync2 - IngressTimeStampSync1	
	Eth_TimeIntDiffType	OriginTimeStampDelta	OriginTimeStampSync2[FUP2]	
			-	
			OriginTimeStampSync1[FUP1]	
Description:	Variables of this type are used to express frequency ratios.			

] ()

8.2.13 Eth_MacVlanType

[SWS_Eth_91001] [

Name:	Eth_MacVlanType		
Туре:	Structure		
Element:	uint8[6]	MacAddr	Specifies the MAC address [0255,0255,0255,0255]
	uint16	VlanId	Specifies the VLAN address 065535
	uint8	SwitchPort	Port of the switch 0255
	uint16	HashValue	Hash value that is generated by the Ethernet switch according the given MacAddr. If the HashValue is not available the value shall be set to 0b1111xxxxxxxxxxxxx == 0xFxxx (invalid value). If the HashValue is available the value shall be set to 0b0000xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Description:	The interpretation of this value is not specified, i.e. whether it is number of used
	bytes or number of used memory cells, etc.

J (SRS_ETH_00086)

8.2.14 Eth_CounterType

[SWS_Eth_91002] [

Name:	Eth_Counte:	rType	
Туре:	Structure		
Element:	uint32	DropPktBufOver	run dropped packets due to buffer overrun
	uint32	DropPktCrc	dropped packets due to CRC errors
	uint32	UndersizePkt	number of undersize packets which were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed. (see IETF RFC 1757)
	uint32	OversizePkt	number of oversize packets which are longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed. (see IETF RFC 1757)
	uint32	AlgnmtErr	number of alignment errors, i.e. packets which are received and are not an integral number of octets in length and do not pass the CRC.
	uint32	SqeTestErr	SQE test error according to IETF RFC1643 dot3StatsSQETestErrors
	uint32	DiscInbdPkt	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. (see IETF RFC 2233 ifInDiscards)
	uint32	ErrInbdPkt	total number of erroneous inbound packets
	uint32	DiscOtbdPkt	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. (see IETF RFC 2233 ifOutDiscards)
	uint32	ErrOtbdPkt	total number of erroneous outbound packets
	uint32	SnglCollPkt	Single collision frames: A count of successfully transmitted frames on a particular interface for which transmission is inhibited by exactly one collision. (see IETF RFC1643 dot3StatsSingleCollisionFrames)
	uint32	MultCollPkt	Multiple collision frames: A count of successfully transmitted frames on a particular interface for which transmission is inhibited by more than

			one collision. (see IETF RFC1643
			dot3StatsMultipleCollisionFrames)
	uint32	DfrdPkt	Number of deferred transmission: A count of frames for which the first transmission attempt on a particular interface is delayed because the medium is busy. (see IETF RFC1643 dot3StatsDeferredTransmissions)
	uint32	LatCollPkt	Number of late collisions: The number of times that a collision is detected on a particular interface later than 512 bit-times into the transmission of a packet. (see IETF RFC1643 dot3StatsLateCollisions)
	uint32	HwDepCtr0	hardware dependent counter value
	uint32	HwDepCtr1	hardware dependent counter value
	uint32	HwDepCtr2	hardware dependent counter value
	uint32	HwDepCtr3	hardware dependent counter value
Description:	Statistic count	er for diagnostics.	

] ()

8.2.15 Eth_RxStatsType

[SWS_Eth_91002] [

Name:	Eth_RxSta	atsType	
Туре:	Structure	9	
Element:	uint32	RxStatsDropEvents	The total number of events in which packets were dropped by the probe due to lack of resources. Also described in IETF RFC 2819 MIB etherStatsDropEvents.
	uint32	RxStatsOctets	The total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets). Also described in IETF RFC 2819 MIB etherStatsOctets.
	uint32	RxStatsPkts	The total number of packets (including bad packets, broadcast packets, and multicast packets) received. Also described in IETF RFC 2819 MIB etherStatsPkts
	uint32	RxStatsBroadcastPkts	The total number of good packets received that were directed to the broadcast address. Also described in IETF RFC 2819 MIB etherStatsBroadcastPkts
	uint32	RxStatsMulticastPkts	The total number of good packets received that were directed to a multicast address. Also described in IETF RFC 2819 MIB etherStatsMulticastPkts.
	uint32	RxStatsCrcAlignErrors	The total number of packets received that had a length of bertween 64 and 1518 octets that

		had either a bad Frame Check
		Sequence (FCS) with an integral
		number of octets (FCS Error) or a
		bad FCS with a non-integral
		number of octets (Alignment Error).
		Also described in IETF RFC 2819
		MIB etherStatsCRCAlignErrors
	D 01 1 17 1 1 1 D1 1	
uint32	RxStatsUndersizePkts	The total number of packets
		received that were less than 64
		octets long (excluding framing bits,
		but including FCS octets) and were
		otherwise well formed. Also
		described in IETF RFC 2819 MIB
		etherStatsUndersizePkts.
uint32	RxStatsOversizePkts	The total number of packets
		received that were longer than
		1518 octets (excluding framing bits,
		but including FCS octets) and were
		otherwise well formed. Also
		described in IETF RFC 2819 MIB
		etherStatsOversizePkts
uint32	RxStatsFragments	The total number of packets
4111002	1415 Cacor Lagineries	received that were less than 64
		octets in length (excluding framing
		bits but including FCS octets) and
		had either a bad Frame Check
		Sequence (FCS) with an integral
		number of octets (FCS Error) or a
		bad FCS with a non-integral
		number of octets (Alignment Error).
		Also described in IETF RFC 2819
		MIB etherStatsFragments.
uint32	RxStatsJabbers	The total number of packets
		received that were longer than
		1518 octets, and had either a bad
		Frame Check Sequence (FCS) with
		an integral number of octets (FCS
		Error) or a bad FCS with a non-
		integral number of octets
		(Alignment Error). Also described in
		ÎETF RFC 2819 MIB
		etherStatsJabbers.
uint32	RxStatsCollisions	The best estimate of the total
		number of collisions on this
		Ethernet segment. Also described
		in IETF RFC 2819 MIB
		etherStatsCollisions
uint32	RxStatsPkts640ctets	
u I I I L J Z	rxstatsrkts040ctets	The total number of packets
		(including bad packets) received
		that were 64 octets in length. Also
		described in IETF RFC 2819 MIB
		etherStatsPkts64Octets
uint32	RxStatsPkts65to1270ctets	The total number of packets
		(including bad packets) received
		that were between 65 and 127
		octets in length. Also described in
		IETF RFC 2819 MIB
		etherStatsPkts65to127Octets
uint32	RxStatsPkts128to2550ctets	The total number of packets

			(including bad packets) received that were between 128 and 255 octets in length. Also described in IETF RFC 2819 MIB etherStatsPkts128to255Octets
	uint32	RxStatsPkts256to5110ctets	The total number of packets (including bad packets) received that were between 256 and 511 octets in length. Also described in IETF RFC 2819 MIB etherStatsPkts256to511Octets
	uint32	RxStatsPkts512to1023Octets	The total number of packets (including bad packets) received that were between 512 and 1023 octets in length. Also described in IETF RFC 2819 MIB etherStatsPkts512to1023Octets
	uint32	RxStatsPkts1024to1518Octets	The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length. Also described in IETF RFC 2819 MIB etherStatsPkts1024to1518Octets
	uint32	RxUnicastFrames	The number of subnetwork-unicast packets delivered to a higher-layer protocol. Also described in IETF RFC1213 MIB ifInUcastPkts
Description:	Statistic counte	er for diagnostics.	

J (SRS_Eth_00127)

8.2.16 Eth_TxStatsType

[SWS_Eth_91003] [

Name:	Eth TxStats	sType	
Туре:	Structure		
Element:	uint32	TxNumberOfOctet	The total number of octets transmitted out of the interface, including framing characters. Also described in IETF RFC1213 MIB ifOutOctets.
	uint32	TxNUcastPkts	The total number of packets that higher- level protocols requested be transmitted to a non-unicast (i.e., a subnetwork- broadcast or subnetwork-multicast) address, including those that were discarded or not sent. Also described in IETF RFC1213 MIB ifOutNUcastPkts
	uint32	TxUniCastPkts	The total number of packets that higher- level protocols requested be transmitted to a subnetwork-unicast address, including those that were discarded or not sent. Also described in IETF RFC1213 MIB ifOutUcastPkts.
Description:	Statistic count	er for diagnostics.	•

J (SRS_Eth_00127)

8.2.17 Eth_TxErrorCounterValuesType

[SWS_Eth_91004] [

Name:	Eth_TxErro	rCounterValuesType	
Туре:	Structure		
Element:	uint32	TxDroppedNoErrorPkt	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. Also described in IETF RFC1213 MIB ifOutDiscards
	uint32	TxDroppedErrorPkts	transmitted because of errors. Also described in IETF RFC1213 MIB ifOutErrors
	uint32	TxDeferredTrans	A count of frames for which the first transmission attempt on a particular interface is delayed because the medium is busy. The count represented by an instance of this object does not include frames involved in collisions. Also described in IETF RFC1643 MIB dot3StatsDeferredTransmissions
	uint32	TxSingleCollision	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by exactly one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the TxUniCastPkts and TxNUcastPkts and is not counted by the corresponding instance of the TxMultipleCollision object. Also described in IETF RFC1643 MIB dot3StatsSingleCollisionFrames
	uint32	TxMultipleCollision	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by more than one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the TxUniCastPkts and TxNUcastPkts and is not counted by the corresponding instance of the TxSingleCollision object. Also described in IETF RFC1643 MIB dot3StatsMultipleCollisionFrames.
	uint32	TxLateCollision	The number of times that a collision is detected on a particular interface later than 512 bit-times into the transmission of a packet. Five hundred and twelve bit-times corresponds to 51.2 microseconds on a 10 Mbit/s system. A (late) collision included in a count represented by an instance of this object is also considered as a (generic) collision for purposes of

		other collision-related statistics. Also described in IETF RFC1643 MIB dot3StatsLateCollisions
	uint32	TxExcessiveCollison A count of frames for which transmission on a particular interface fails due to excessive collisions. Also described in IETF RFC1643 MIB dot3StatsExcessiveCollisions
Description:	Statistic coun	ters for diagnostics.

| (SRS_Eth_00127)

8.3 Function definitions

This is a list of functions provided for upper layer modules.

8.3.1 Eth_Init

[SWS_Eth_00027] [

[3W3_EIII_0002	<u>'] </u>			
Service name:	Eth_Init			
Syntax:		void Eth_Init(const Eth_ConfigType* CfgPtr)		
Service ID[hex]:	0x01			
Sync/Async:	Synchron	Synchronous		
Reentrancy:	Non Reer	ntrant		
Parameters (in):	CfgPtr	Points to the implementation specific structure		
Parameters (inout):	None	None		
Parameters (out):	None			
Return value:	None	None		
Description:	Initializes	the Ethernet Driver		

() [SWS_Eth_00028][

The function shall store the access to the configuration structure for subsequent API calls. |()

[SWS_Eth_00034] [

The function shall for all configured Ethernet controllers in the current EthConfigSet:

- Disable all controller
- Clear pending Ethernet interrupts
- Configure all controller configuration parameters (e.g. interrupts, frame length, frame filter, ...)
- Configure all transmit / receive resources (e.g. buffer initialization)
- delete all pending transmit and receive requests ()

[SWS_Eth_00029][

The function shall change the state of the component from ETH_STATE_UNINIT to ETH_STATE_INIT.]()

[SWS_Eth_00039] [

The function shall check the access to the Ethernet controller. If the check fails, the function shall raise the production error ETH_E_ACCESS. ()

[SWS_Eth_00031][

Caveat: The API has to be called during initialization. J()

8.3.2 Eth SetControllerMode

ISWS Eth 000411

[3 11 3_LIII_0004	• 』		
Service name:	Eth_SetControllerMode		
Syntax:	<pre>Std_ReturnType Eth_SetControllerMode(uint8 CtrlIdx, Eth_ModeType CtrlMode)</pre>		
Service ID[hex]:	0x03		
Sync/Async:	Asynchronous		
Reentrancy:	Non Reentrant		
Parameters (in):	Ctrlldx CtrlMode	Index of the controller within the context of the Ethernet Driver ETH_MODE_DOWN: disable the controller ETH_MODE_ACTIVE: enable the controller	
Parameters (inout):	None		
Parameters (out):	None		
Return value:	Std_ReturnType E_OK: success E_NOT_OK: controller mode could not be changed		
Description:	Enables / disable	s the indexed controller	

] () [SWS_Eth_00042] [

The function shall:

- Put the controller in the specified mode given in the parameter 'CtrlMode'
 - Upon mode ETH MODE DOWN the driver shall:
 - Disable the Ethernet controller
 - Reset all transmit and receive buffers (i.e. ignore all pending transmission and reception requests)
 - O Upon mode ETH_MODE_ACTIVE:
 - Enable all transmit and receive buffers
 - Enable the Ethernet controller()

[SWS Eth 00043] [

If development error detection is enabled: the function shall check that the service Eth_Init was previously called. If the check fails, the function shall raise the development error ETH_E_UNINIT otherwise (if DET is disabled) return E_NOT_OK.]()

[SWS Eth 00044] [

If development error detection is enabled: the function shall check the parameter Ctrlldx for being valid. If the check fails, the function shall raise the development error ETH_E_INV_CTRL_IDX otherwise (if DET is disabled) return E_NOT_OK. J()

[SWS_Eth_00168] [

The function shall check the access to the Ethernet controller. If the check fails, the function shall raise the production error ETH_E_ACCESS and return E_NOT_OK.J()

[SWS_Eth_00045] [

Caveat: The function requires previous controller initialization (Eth_Init). J()

8.3.3 Eth_GetControllerMode

[SWS_Eth_00046] [

O110_Em_000+			
Service name:	Eth_GetControllerMode		
Syntax:	Std_ReturnType Eth_GetControllerMode(
	uint8 Ctr	·	
	Eth_Mode1	'ype* CtrlModePtr	
)		
Service ID[hex]:	0x04		
Sync/Async:	Synchronous		
Reentrancy:	Non Reentrant		
Parameters (in):	Ctrlldx	Index of the controller within the context of the Ethernet Driver	
Parameters	None		
(inout):			
Doromotoro (out)	CtrlModePtr	ETH_MODE_DOWN: the controller is disabled	
Parameters (out):		ETH_MODE_ACTIVE: the controller is enabled	
Return value:	Std_ReturnType	E_OK: success	
Return value:		E_NOT_OK: controller mode could not be obtained	
Description:	Obtains the state	of the indexed controller	

() [SWS_Eth_00047] [

The function shall read the current controller mode. I()

[SWS Eth 00048] [

If development error detection is enabled: the function shall check that the service Eth_Init was previously called. If the check fails, the function shall raise the development error ETH_E_UNINIT otherwise (if DET is disabled) return E_NOT_OK. I()

[SWS_Eth_00049] [

If development error detection is enabled: the function shall check the parameter Ctrlldx for being valid. If the check fails, the function shall raise the development error ETH_E_INV_CTRL_IDX otherwise (if DET is disabled) return E_NOT_OK. J()

[SWS Eth 00050] [

If development error detection is enabled: the function shall check the parameter CtrlModePtr for being valid. If the check fails, the function shall raise the development error ETH_E_PARAM_POINTER otherwise (if DET is disabled) return E_NOT_OK.]()

[SWS Eth 00051] [

Caveat: The function requires previous controller initialization (Eth. Init). (()

8.3.4 Eth_GetPhysAddr

[SWS Eth 00052] [

<u> </u>	
Service name:	Eth_GetPhysAddr

Syntax:	<pre>void Eth_GetPhysAddr(uint8 CtrlIdx, uint8* PhysAddrPtr)</pre>	
Service ID[hex]:	0x08	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	Ctrlldx	Index of the controller within the context of the Ethernet Driver
Parameters (inout):	None	
Parameters (out):	PhysAddrPtr	Physical source address (MAC address) in network byte order.
Return value:	void	None
Description:	Obtains the physical source address used by the indexed controller	

1 ()

[SWS_Eth_00053] [

The function shall read the source address used by the indexed controller. |()

[SWS_Eth_00054] [

If development error detection is enabled: the function shall check that the service Eth_Init was previously called. If the check fails, the function shall raise the development error ETH_E_UNINIT. J()

[SWS_Eth_00055] [

If development error detection is enabled: the function shall check the parameter Ctrlldx for being valid. If the check fails, the function shall raise the development error ETH_E_INV_CTRL_IDX. |()

[SWS_Eth_00056] [

If development error detection is enabled: the function shall check the parameter PhysAddrPtr for being valid. If the check fails, the function shall raise the development error ETH_E_PARAM_POINTER. (()

[SWS Eth 00057] [

Caveat: The function requires previous controller initialization (Eth_Init). |()

8.3.5 Eth_SetPhysAddr

[SWS_Eth_00151] [

Service name:	Eth_SetPhysAddr		
Syntax:	<pre>void Eth_SetPhysAddr(uint8 CtrlIdx, const uint8* PhysAddrPtr)</pre>		
Service ID[hex]:	0x13		
Sync/Async:	Synchronous		
Reentrancy:	Non Reentrant for the same Ctrlldx, reentrant for different		
Paramatara (in)	Ctrlldx Index of the Ethernet controller within the context of the Ethernet Driver.		
Parameters (in):	PhysAddrPtr Pointer to memory containing the physical source address (MAC address) in network byte order.		
Parameters (inout):	None		

Parameters (out):	None
Return value:	None
Description:	Sets the physical source address used by the indexed controller

() [SWS_Eth_00139] [

The function shall update the source address used by the indexed controller. J()

[SWS Eth 00140] [

If development error detection is enabled: the function shall check that the service Eth_Init was previously called. If the check fails, the function shall raise the development error ETH E UNINIT. (()

[SWS_Eth_00141] [

If development error detection is enabled: the function shall check the parameter Ctrlldx for being valid. If the check fails, the function shall raise the development error ETH_E_INV_CTRL_IDX. ()

[SWS Eth 00142][

If development error detection is enabled: the function shall check the parameter PhysAddrPtr for being valid. If the check fails, the function shall raise the development error ETH_E_PARAM_POINTER. (()

[SWS Eth 00143] [

Caveat: The function requires previous controller initialization (Eth_Init). (()

8.3.6 Eth UpdatePhysAddrFilter

[SWS_Eth_00152] [

Service name:	Eth_UpdatePhysAddrFilter	
Syntax:	<pre>Std_ReturnType Eth_UpdatePhysAddrFilter(uint8 CtrlIdx, const uint8* PhysAddrPtr, Eth_FilterActionType Action)</pre>	
Service ID[hex]:	0x12	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant for the same Ctrlldx, reentrant for different	
Parameters (in):		Index of the Ethernet controller within the context of the Ethernet Driver
		Pointer to memory containing the physical destination address (MAC address) in network byte order. This is the multicast destination address of the layer 2 Ethernet packet.
	Action	Add or remove the address from the Ethernet controllers filter.
Parameters (inout):	None	
Parameters (out):	None	
Return value:	Std_ReturnType E_OK: filter was successfully changed E_NOT_OK: filter could not be changed	
Description:	Update the physical source address to/from the indexed controller filter. If the Ethernet Controller is not capable to do the filtering, the software has to do this.	

]() [SWS_Eth_00150][

The function shall update the physical address receive filter of the indexed controller.]()

[SWS_Eth_00245][

The Ethernet driver module will receive a frame when the destination Address match the PhyAddrPtr passed here. (e.g matching can be done via hash table or simple pattern matching) | ()

Note: Underlying HW mechanism can be used if available. Otherwise the Ethernet driver needs to do this by software.

[SWS_Eth_00246][

If the matching is positive, the upper layer shall be notified by calling RxIndication() callback.

If the matching is negative, the frame shall be discarded. (1)

[SWS_Eth_00164] [

If development error detection is enabled: the function shall check that the service Eth_Init was previously called. If the check fails, the function shall raise the development error ETH_E_UNINIT. |()

[SWS_Eth_00165][

If development error detection is enabled: the function shall check the parameter Ctrlldx for being valid. If the check fails, the function shall raise the development error ETH_E_INV_CTRL_IDX. I()

[SWS_Eth_00166] [

If development error detection is enabled the function shall check the parameter PhysAddrPtr for being valid. If the check fails, the function shall raise the development error ETH_E_PARAM_POINTER. (()

[SWS_Eth_00167] [

Caveat: The function requires previous controller initialization (Eth. Init). ()

[SWS_Eth_00144] [

If the physical source address (MAC address) is set to FF:FF:FF: FF:FF:FF, this shall completely open the filter. J()

[SWS_Eth_00146][

If this API is used and the hardware does not support filtering, promiscuous mode shall be enabled during initialization. J()

[SWS_Eth_00147] [

If the physical source address (MAC address) is set to 00:00:00:00:00:00, this shall reduce the filter to the controllers unique unicast MAC address and end promiscuous mode if it was turned on.]()

8.3.7 Eth_WriteMii

[SWS Eth 00058] [

Service name: Eth_WriteMii

Syntax:	<pre>Std_ReturnType Eth_WriteMii(uint8 CtrlIdx, uint8 TrcvIdx, uint8 RegIdx, uint16 RegVal)</pre>	
Service ID[hex]:	0x05	
Sync/Async:	Asynchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	Ctrlldx Trcvldx Regldx RegVal	Index of the controller within the context of the Ethernet Driver Index of the transceiver on the MII (see [21] for details) Index of the transceiver register on the MII (see [21] for details) Value to be written into the indexed register (see [21] for details)
Parameters (inout):	None	
Parameters (out):	None	
Return value:	Std_ReturnType E_OK: Service accepted E_NOT_OK: Service denied	
Description:	Configures a tran	sceiver register or triggers a function offered by the receiver

() [SWS_Eth_00059] [

The function shall write the specified transceiver register through the MII of the indexed controller. |()

[SWS_Eth_00241][

The function shall call EthTrcv_WriteMiiIndication when the MII access finished. ()

[SWS_Eth_00060] [

If development error detection is enabled: the function shall check that the service Eth_Init was previously called. If the check fails, the function shall raise the development error ETH_E_UNINIT. |()

[SWS_Eth_00061] [

Sync/Async:	Synchronous		
Reentrancy:	Reentrant		
Parameters (in):	None		
Parameters	None		
(inout):			
Parameters (out):	VersionInfoPtr	Version information of this module	
Return value:	void	None	
Description:	Returns the version information of this module		

I()

[SWS_Eth_00136] [

If development error detection is enabled: the function shall check the parameter VersionInfoPtr for being valid. If the check fails, the function shall raise the development error ETH_E_PARAM_POINTER. |()

8.4 Callback notifications

The Ethernet Driver does not provide any callback functions.

8.5 Scheduled functions

8.5.1 Eth_MainFunction

[SWS_Eth_00171] [

Service name:	Eth_MainFunction	
Syntax:	void Eth_MainFunction(
	void	
Service ID[hex]:	0x20	
Description:	The function checks for controller errors and lost frames. Used for polling state	
	changes. Calls EthIf_CtrlModeIndication when the controller mode changed.	

I()

[SWS_Eth_00169] [

The function shall check for lost frames. If the check fails, the function shall raise the extended production error event ETH_E_RX_FRAMES_LOST. I()

[SWS Eth 00172] [

The function shall check for controller errors (e.g. CRC errors). If the check fails, the function shall raise the extended production error event as defined in section 7.2.2 Extended Production Errors (e.g. ETH_E_CRC). |()

[SWS Eth 00240][

Used for polling state changes. Calls EthIf_CtrlModeIndication when the controller mode changed. J()

8.6 Expected Interfaces

This chapter lists all interfaces required from other modules.

8.6.1 Mandatory Interfaces

This chapter defines all interfaces required to fulfill the core functionality of the module.

[SWS_Eth_00119] [

5110_Eui_00110]		
API function	Description	
Dem_SetEventStatus	Called by SW-Cs or BSW modules to report monitor status information to the Dem. BSW modules calling Dem_SetEventStatus can safely ignore the return value.	
EthIf_CtrlModeIndication	Called asynchronously when mode has been read out. Triggered by previous Eth_SetControllerMode call. Can directly be called within the trigger functions.	
EthIf_RxIndication	Handles a received frame received by the indexed controller	
EthIf_TxConfirmation	Confirms frame transmission by the indexed controller	
SchM_Enter_Eth	Invokes the SchM_Enter function to enter a module local exclusive area.	
SchM_Exit_Eth	Invokes the SchM_Exit function to exit an exclusive area.	

] ()

8.6.2 Optional Interfaces

This chapter defines all interfaces required to fulfill an optional functionality of the module.

[SWS_Eth_00120] [

API function	Description	
Det_ReportError	Service to report development errors.	
EthSwt_EthRxFinishedIndication	Indication for a finished receive process for a specific Ethernet frame, which results in providing the management information retrieved during EthSwt_EthRxProcessFrame().	
EthSwt_EthRxProcessFrame	Function inspects the Ethernet frame passed by the data pointer for management information and stores it for later use in EthSwt_EthRxFinishedIndication().	
	Modifies the buffer length to be able to insert management information.	
EthSwt_EthTxFinishedIndication	Indication for a finished transmit process for a specific Ethernet frame.	
EthSwt_EthTxPrepareFrame	Prepares the Ethernet frame for common Ethernet communication (frame shall be handled by switch according to the common address resolution behavior) and stores the information for processing of EthSwt_EthTxFinishedIndication().	
EthSwt_EthTxProcessFrame	Function inserts management information into the Ethernet frame.	

8.6.3 Configurable interfaces

The Ethernet Driver does not use configurable interfaces.

Terms and definitions:

Reentrant: interface is expected to be reentrant

Don't care: reentrancy of interface not relevant for this module (in general it is in this

case not reentrant).

9 Sequence diagrams

The usage of the Ethernet Driver is depicted in the sequence diagrams of the Ethernet Interface.

10 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification Chapter 10.1 describes fundamentals. It also specifies a template (table) you shall use for the parameter specification. We intend to leave Chapter 10.1 in the specification to guarantee comprehension.

Chapter 10.2 specifies the structure (containers) and the parameters of the module Ethernet Driver.

Chapter 10.3 specifies published information of the module Ethernet Driver.

.

10.1 Containers and configuration parameters

The following chapters summarize all configuration parameters. The detailed meanings of the parameters describe Chapters 7 and Chapter 8.

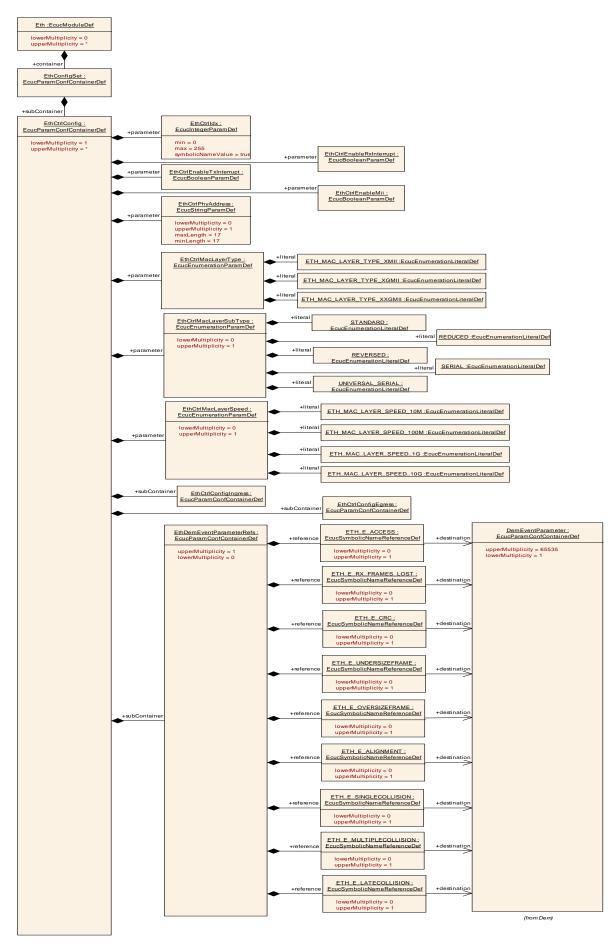

Figure 10.1: Ethernet Driver configuration structure

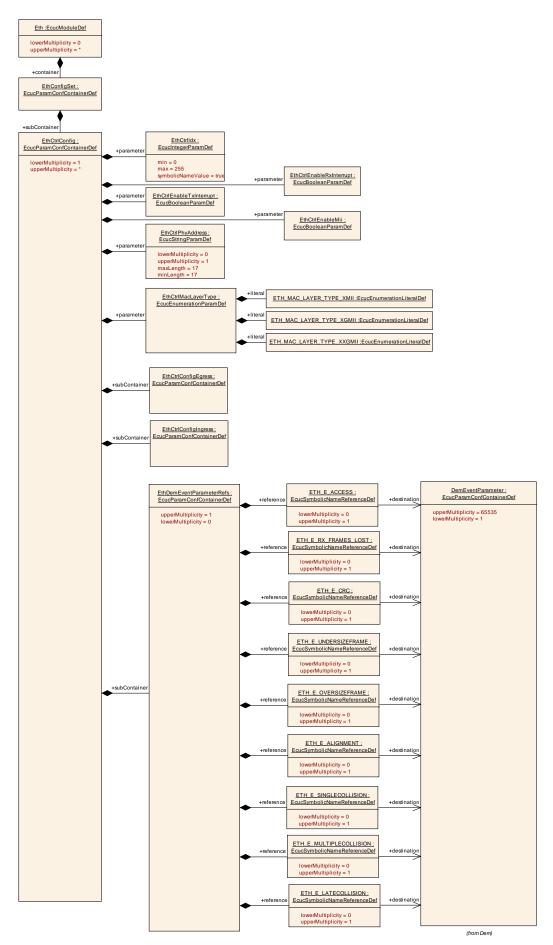

Figure 10.2: Ethernet Driver Controller configuration structure

10.1.1 Eth

SWS Item	ECUC_Eth_00038:
Module Name	Eth
Module Description	Configuration of the Eth (Ethernet Driver) module.
Post-Build Variant Support	true
Supported Config Variants	VARIANT-LINK-TIME, VARIANT-POST-BUILD, VARIANT-PRE-COMPILE

Included Containers		
Container Name	Multiplicity	Scope / Dependency
EthConfigSet		This container contains the configuration parameters and sub containers of the AUTOSAR Eth module.
EthGeneral	1	General configuration of Ethernet Driver module

10.1.2 EthConfigSet

SWS Item	ECUC_Eth_00015:
Container Name	EthConfigSet
II JASCRINTIAN	This container contains the configuration parameters and sub containers of the AUTOSAR Eth module.
Configuration Parameters	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
EthCtrlConfig	1*	Configuration of the individual controller

10.1.3 EthCtrlConfig

SWS Item	ECUC_Eth_00006:
Container Name	EthCtrlConfig
Description	Configuration of the individual controller
Configuration Parameters

10.1.12 EthGeneral

SWS Item	ECUC_Eth_00001:
Container Name	EthGeneral
Description	General configuration of Ethernet Driver module
Configuration Parameters	

SWS Item	ECUC_Eth_00003:			
Name	EthDevErrorDetect			
Parent Container	EthGeneral			
Description	Switches the development e	rror de	etection and notification on or off.	
	 true: detection and notification is enabled. false: detection and notification is disabled. 			
Multiplicity	1			
Туре	EcucBooleanParamDef			
Default value	false			
Post-Build Variant Value	false	false		
Value Configuration Class	Pre-compile time X All Variants			
	Link time			
	Post-build time			
Scope / Dependency	scope: local			

SWS Item	ECUC_Eth_00035:			
Name	EthGetDropCountApi			
Parent Container	EthGeneral			
Description	Enables / Disables Eth_Get	Counte	erValues API.	
Multiplicity	1			
Туре	EcucBooleanParamDef			
Default value				
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	Χ	All Variants	
	Link time			
	Post-build time			
Scope / Dependency	scope: local			

SWS Item	ECUC_Eth_00036:			
Name	EthGetEtherStatsApi	EthGetEtherStatsApi		
Parent Container	EthGeneral			
Description	Enables / Disables Eth_GetE	therS	Stats API.	
Multiplicity	1			
Type	EcucBooleanParamDef			
Default value				
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	Pre-compile time X All Variants		
	Link time			
	Post-build time			
Scope / Dependency	scope: local			

SWS Item	ECUC_Eth_00061:
Name	EthGetTxErrorCounterValuesApi
Parent Container	EthGeneral
Description	Enables/Disables Eth_GetTxErrorCounterValues API.
Multiplicity	1
Type	EcucBooleanParamDef

Default value	false		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time X All Variants		
	Link time		
	Post-build time		
Scope / Dependency	scope: local		

SWS Item	ECUC_Eth_00060:			
Name	EthGetTxStatsApi			
Parent Container	EthGeneral			
Description	Enables/Disables Eth_GetTx	Enables/Disables Eth_GetTxStats API.		
Multiplicity	1			
Туре	EcucBooleanParamDef			
Default value	false			
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	Pre-compile time X All Variants		
	Link time			
	Post-build time			
Scope / Dependency	scope: local	•		

SWS Item	ECUC_Eth_00037:			
Name	EthGlobalTimeSupport			
Parent Container	EthGeneral			
Description			APIs used amongst others by Global	
	Time Synchronization over E	thern	et.	
Multiplicity	1			
Туре	EcucBooleanParamDef			
Default value				
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time X All Variants			
	Link time			
	Post-build time			
Scope / Dependency	scope: local	•		

SWS Item	ECUC_Eth_00018:			
Name	EthIndex			
Parent Container	EthGeneral	EthGeneral		
Description	Specifies the InstanceId of this module instance. If only one instance is present it shall have the Id 0.			
Multiplicity	1			
Туре	EcucIntegerParamDef	EcucIntegerParamDef		
Range	0 255			
Default value				
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	Χ	All Variants	
	Link time			
	Post-build time			
Scope / Dependency	scope: local			

SWS Item	ECUC_Eth_00022:
Name	EthMainFunctionPeriod
Parent Container	EthGeneral
	Specifies the period of main function Eth_MainFunction in seconds. Ethernet driver does not require this information but the BSW scheduler.
Multiplicity	1
Туре	EcucFloatParamDef

Range]0 INF[
Default value				
Post-Build Variant Value	false	false		
Value Configuration Class	Pre-compile time X All Variants			
	Link time			
	Post-build time			
Scope / Dependency	scope: local			
·	<u> </u>			

SWS Item	ECUC_Eth_00002:			
Name	EthMaxCtrlsSupported			
Parent Container	EthGeneral			
Description	Limits the total number of su	pporte	ed controllers.	
Multiplicity	1			
Туре	EcucIntegerParamDef			
Range	1 255	1 255		
Default value				
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	Χ	All Variants	
	Link time			
	Post-build time			
Scope / Dependency	scope: local			

SWS Item	ECUC_Eth_00019 : (Obsolete)			
Name	EthUpdatePhysAddrFilter			
Parent Container	EthGeneral	EthGeneral		
Description	Enables/Disables optional A	API Eth	_UpdatePhysAddrFilter.	
	Tags:			
	atp.Status=obsolete			
Multiplicity	01			
Туре	EcucBooleanParamDef			
Default value	false			
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	X	All Variants	
	Link time			
	Post-build time			
Scope / Dependency	scope: local			

SWS Item	ECUC_Eth_00004:			
Name	EthVersionInfoApi	EthVersionInfoApi		
Parent Container	EthGeneral			
Description	Enables / Disables version in	nfo AF	ol .	
Multiplicity	1			
Туре	EcucBooleanParamDef	EcucBooleanParamDef		
Default value	false			
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	Χ	All Variants	
	Link time			
	Post-build time			
Scope / Dependency	scope: local		·	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
EthCtrlOffloading	1	Configuration of hardware offloading features.

10.1.13 EthCtrlOffloading

SWS Item	ECUC_Eth_00030:
Container Name	EthCtrlOffloading
Description	Configuration of hardware offloading features.
Configuration Parameters	

SWS Item	ECUC_Eth_00032:		
Name	EthCtrlEnableOffloadChecksumICMP		
Parent Container	EthCtrlOffloading		
Description	Enables / Disables hardware	offloa	ading for ICMP checksums.
Multiplicity	1		
Type	EcucBooleanParamDef		
Default value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	Χ	All Variants
	Link time		
	Post-build time		
Scope / Dependency	scope: local	•	

SWS Item	ECUC_Eth_00031:		
Name	EthCtrlEnableOffloadChecksumIPv4		
Parent Container	EthCtrlOffloading		
Description	Enables / Disables hardware	offlo	ading for IPv4 checksums.
Multiplicity	1		
Туре	EcucBooleanParamDef		
Default value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	Χ	All Variants
	Link time		
	Post-build time		
Scope / Dependency	scope: local		

SWS Item	ECUC_Eth_00033:		
Name	EthCtrlEnableOffloadChecksumTCP		
Parent Container	EthCtrlOffloading		
Description	Enables / Disables hardware	offloa	ading for TCP checksums.
Multiplicity	1		
Туре	EcucBooleanParamDef		
Default value			
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	Χ	All Variants
	Link time		
	Post-build time		
Scope / Dependency	scope: local		

SWS Item	ECUC_Eth_00034:			
Name	EthCtrlEnableOffloadChecksumUDP			
Parent Container	EthCtrlOffloading			
Description	Enables / Disables hardware offloading for UDP checksums.			
Multiplicity	1			
Туре	EcucBooleanParamDef			
Default value				
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time X All Variants			

	Link time	
	Post-build time	
Scope / Dependency	scope: local
